Art Unit: 1626

DETAILED ACTION

Claims 1-33, 35 & 45-47 are pending in the instant application, of which: Claims 1, 5, 6, 35, 45 & 46 are currently amended. Claims 34 & 36-44 are cancelled.

Priority

This application is a 371 of PCT/US04/18180, filed on 06/07/2004.

Acknowledgement is made of Applicants' claim for benefit of US Provisional Patent

Applications 60/477,972, filed on 06/12/2003, and 60/497,787, filed 08/26/2003. Said claim has been made in the oath and/or in the first paragraph of the Specification.

Information Disclosure Statement

Applicants' information disclosure statement (IDS), filed on 12/08/2005 has been considered. Please refer to Applicants' copy of the 1449 submitted herein. NOTE: IDS documents with a line crossed through them have not been provided.

Allowable Subject Matter

The compounds according to formula (I) are free of the prior art; nothing known in the art anticipates or renders the compounds of the instant application obvious. The closest prior art related to the formula I is compound RN 142283-84-9, taught by Ong *et al.* (EP 496314, 07/29/1992, see IDS). Compound RN 142283-84-9 is a substituted 1,2,3,4-tetrahydrocyclopent[b]indole, meaning that the five-membered ring fused to the

Art Unit: 1626

indole is not aromatic. Said compound fulfils the limitations of formula (I) wherein $\mathbf{n} = 0$, $\mathbf{Y} = C(O)$, etc., with the exception of $\mathbf{X} = -OCH_2$, which is not claimed.

Claim Rejections - 35 USC § 112, 2nd

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 33 is rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Said claims recites a compound of formula (I) that further comprising a compound of formula (I) and the scope of this term is unclear, such that it fails to define the metes and bounds of its limitation. Perhaps it was intended for the claim to read, "The compound of formula (I) in claim 1 wherein R⁶...; and R⁷ is..." however, it is unclear. A compound cannot further comprise another compound (a composition is a mixture of two or more compounds. Appropriate correction is required.

Claim Rejections - 35 USC § 112, 1st

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 1 & 33 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for compounds of formula (I), and salts and solvates thereof, the specification does not reasonably provide enablement for "physiological"

Art Unit: 1626

functional derivatives thereof," (Claims 1 & 33). The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the invention commensurate in scope with these claims.

Undue experimentation is a conclusion reached by weighing the noted factual considerations set forth below as seen in *In re Wands*, 858 F.2d 731, 737, 8 USPQ2d 1400, 1404 (Fed. Cir. 1988). A conclusion of lack of enablement means that, based on the evidence regarding a fair evaluation of an appropriate combination of the factors below, the specification, at the time the application was filed, would not have taught one skilled in the art how to make and/or use the full scope of the claimed invention without undue experimentation.

These factors include:

- (A) The breadth of the claims;
- (B) The nature of the invention;
- (C) The state of the prior art;
- (D) The level of one of ordinary skill;
- (E) The level of predictability in the art;
- (F) The amount of direction provided by the inventor;
- (G) The existence of working examples; and
- (H) The quantity of experimentation needed to make or use the invention based on the content of the disclosure.

The breadth of the claims - The nature of the invention

Claim 1 is drawn to tetrahydrocarbazoles according to formula (I), wherein the definitions of R, X, Y, A, R¹, n, t, p & q are defined therein. Compounds according to formula (I) are useful as pharmaceuticals. Furthermore, pharmaceutically acceptable salts, solvates, and physiological functional derivatives thereof are encompassed by this claim (and Claim 33).

Art Unit: 1626

The state of the prior art & The level of predictability in the art

With respect to pharmaceutically acceptable salts, solvates, and physiological functional derivatives thereof, the state of the art is more advanced for solvates and salts, than it is for "physiological functional derivatives." Said term includes esters, amides, and prodrugs (specification, page 15). Esters and amides are indicative of the chemical design, however these examples do not limit the term. Prodrugs are included in this broad term. The state of the prior art is that prodrugs are an inactive form of a drug that exerts its effects after metabolic processes within the body converts it to a usable or active form. In other words, a prodrug is a drug that must be activated before it can produce a physiological effect. Prodrugs are designed to be appended to a particular functional group such as a carboxylic acid, alcohol, amine, phosphate, or phosphonic acid. Research is required to match the prodrug with the particular drug to overcome challenges including stability, rate of systemic prodrug cleavage, and safety. Furthermore, it needs to be decided what enzyme system is wanted to cleave the prodrug followed by the evaluation of the prodrug analogs in assays to measure progress in achieving the desired properties (stability, solubility, cleavage of prodrug in biological matrices, pharmacokinetics in animal models, efficacy in animal models, and safety in animal models). This process is exactly like the process used to discover the active drug. The difficulty of discovering effective prodrugs is often underestimated and for all of the aforementioned reasons, the claimed invention is highly unpredictable.

The amount of direction provided by the inventor

The instant specification is not seen to provide adequate guidance, which would allow the skilled artisan to extrapolate from the disclosure and examples provided, to use the claimed method commensurate in the scope with the instant claims. The only guidance with respect to salts, solvates and derivatives of formula (I) are the definitions located on page 15 of the specification.

The existence of working examples

There has not been provided sufficient evidence that would warrant the skilled artisan to accept the data and information provided in the working examples as correlative proof that *any* derivative as claimed, would be able to be synthesized using the methods outlined in Scheme 1. Furthermore, no examples have been presented for any salts, solvates and derivatives of a compound according to formula (I).

The level of the skill in the art and the quantity of experimentation needed

The level of skill in the art is high. However, due to the unpredictability in the pharmaceutical art, it is noted that discovering effective prodrugs is often underestimated and the process mimics the process conducted to discover the active drug. Thus, the specification fails to provide sufficient support for the broad use of a prodrug of a compound according to formula (I).

Genentech Inc. v. Novo Nordisk A/S (CA FC) 42 USPQ2d 1001 states, "a patent is not a hunting license. It is not a reward for search, but compensation for its

Art Unit: 1626

successful conclusion" and "patent protection is granted in return for an enabling disclosure of an invention, not for vague intimations of general ideas that may or may not be workable".

Therefore, in view of the Wands factors and *In re Fisher* (CCPA 1970) discussed above, to practice the claimed invention herein, a person of skill in the art would have to engage in undue experimentation to test which prodrug design (functional group manipulation) will work for this class of compounds to determine if they would be encompassed in the instant claims, with no assurance of success. *This rejection can be overcome by deleting the unsupported language*.

Claims 45-47 are rejected under 35 U.S.C. § 112, first paragraph, because the specification, while enabling for the compounds and compositions described above and a method of using for the *treatment* of papovavirus, does not reasonably provide enablement for 1) the *prophylaxis* of papovavirus, or 2) the treatment or prophylaxis of all oncogenic viruses such as adenoviruses and retroviruses. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make the invention commensurate in scope with these claims.

The nature of the invention

The nature of the invention is compounds and compositions of formula (I), the process for preparing these compounds, and methods of using these compounds.

The state of the prior art and the predictability or lack thereof in the art

The state of the prior art, namely pharmacological art, involves screening *in vitro* and *in vivo* to determine if the compounds exhibit desired pharmacological activities, which are then tested for their efficacy on human beings. There is no absolute predictability even in view of the seemingly high level of skill in the art. The existence of these obstacles establishes that the contemporary knowledge in the art would prevent one of ordinary skill in the art from accepting any therapeutic regimen on its face. The instant claimed invention is highly unpredictable as discussed below.

It is noted that the pharmaceutical art is unpredictable, requiring each embodiment to be individually assessed for physiological activity. *In re Fisher*, 427 F.2d 833, 839, 166 USPQ 18 (CCPA 1970) indicates that the more unpredictable an area is, the more specific enablement is necessary in order to satisfy the statute. In the instant case, the claimed invention is highly unpredictable since one skilled in the art would recognize that a group of compounds and compositions may provide a treatment for papovavirus, but it does not mean that the same group of compounds and compositions may prevent papovavirus. Furthermore, one of skill in the art would recognize that a family of compounds may treat papovavirus, bit it does not mean that the same family of compounds can treat other oncogenic viruses, such as adenoviruses and retroviruses.

Recently, the FDA approved Gardasil as the first prophylactic HPV vaccine.

However, Gardasil contains recombinant virus-like particles assembled from the L1 (the HPV major capsid protein) proteins of HPVs 6, 11, 16 & 18. Gardasil is a non-

analogous biotechnology with respect to the compounds according to formula (I), which are small molecule therapeutics.

The amount of direction or guidance present and the presence or absence of working examples

There is no direction or guidance provided which supports Applicant's claimed method for the *prophylaxis* of papovavirus or for the treatment of other oncogenic viruses such as adenoviruses and retroviruses, as indicated. The direction or guidance present in Applicants' Specification for a method of using the compounds and compositions of formula (I) to *treat* clinical conditions of HPV infection is found on pages 55 & 56.

The breadth of the claims, quantity of experimentation, and level of skill in the art

Claims 45-47 are drawn to "...use as medicament for the prophylaxis or treatment..." Prophylaxis is commonly known to be synonymous with prevention. In order to prevent a disease, one would need to precisely identify those subjects likely to acquire such a disease, administer Applicant's claimed invention, and then demonstrate that if the identified subject did not develop the disease, such an effect was the direct result of administration of the claimed invention.

Because of the aforementioned reasons, a person of skill in the art could not practice the claimed invention herein, or a person of skill in the art could practice the claimed invention herein only with undue experimentation and with no assurance of

Application/Control Number: 10/560,016 Page 10

Art Unit: 1626

success. Deleting the word "prophylaxis" in **Claims 45 & 46** as well as the non-enabled oncogenic viruses: adenoviruses and retroviruses, can overcome this rejection.

Claim Objections

Claims 2-32 & 35 are objected to as being dependent upon a rejected base

Claim 1, but would be allowable if rewritten in independent form including all of the

limitations of the base claim and any intervening claims.

Application/Control Number: 10/560,016 Page 11

Art Unit: 1626

Telephone Inquiry

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jason M. Nolan, Ph.D. whose telephone number is (571) 272-4356 and electronic mail is Jason.Nolan@uspto.gov. The examiner can normally be reached on Mon - Fri (9:00 - 5:30PM). If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Joseph McKane can be reached on (571) 272-0699. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
